DETAIL OF ACTION

1. Claims 1-11 and 36-49 stand rejected under 35 U.S.C. 102(b) as being clearly anticipated by Dierke (5,854,757).

Dierke discloses in cols. 3-7 a fast discrete cosine transform including arranging transform equations into at least one collection (transform matrix T) of at least two discrete transform equations (each row of the transform matrix corresponding to a discrete transform equations) and having at least two transform constants, and independently scaling the transform constants for each collection with a scaling term (S). The scaling terms are chosen to simplify the transform equations and enable the scaled transform constants (N) to be represented by sums of power of 2 terms inherently with an error within a predetermined error allowance.

2. Claims 12-35 stand rejected under 35 U.S.C. 103(a) as being unpatentable over Dierke (5,854,757).

It is noted that Dierke does not disclose a use of the data processing in a data compression system, especially in a printer. However, since the use of discrete cosine transform in a compression system is well-known in the art, a person of ordinary skill in the art would have found it an obvious application to use the discrete cosine transform as taught by Dierke in a data compression system and in a printer as claimed in order to reduce circuitry and processing time.

3

Serial No: 09/694,452 Art Unit: 2124

3. Claims 1-49 stand rejected under 35 U.S.C. 103(a) as being unpatentable over Pineda (5,701,263) in view of Mattela et al. (5,781,239).

As per claims 1-11 and 36-49, Pineda discloses in cols. 3-5 a fast discrete cosine transform processing including arranging transform equations into at least one collection (transform matrix) of at least two discrete transform equations (each row of the transform matrix corresponding to a discrete transform equations) and having at least two transform constants, and independently scaling the transform constants for each collection with a scaling term (Pu). The scaling terms are chosen inherently according to a predetermined cost function. It is noted that Pineda does not disclose the scaled transform constants (Txu) represented by sums of power of 2 terms. However, Mattela et al. suggests in figure 16 and in col. 15, lines 50 - col. 16 line 18 the representations of the scaled transform constants by sums of power of 2 terms in order to perform multiplications by simple shift/add operations. Thus it would have been obvious to a person of ordinary skill in the art to represent the scaled transform constants (Txu) of Pineda by sums of power of 2 terms for performing multiplications by simple shift/add operations as taught by Pineda in order to reduce circuitry and processing time.

As per claims 12-35, the combination of Pineda and Mattela et al. do not disclose a use of the discrete cosine transform processing in a data compression system, especially in a printer. However, since the use of data transform in a compression system is well-known in the art, a person of ordinary skill in the art would have found it an obvious application to use the data processing as taught by combined references in a data compression system and in a printer as claimed in order to reduce circuitry and processing time.

4

4. Applicant's arguments filed 11-18-2002 have been fully considered but they are not persuasive because the claims only require the transform equations to be arranged into at least one collection, the applied references clearly arranging transform equations into at least one collection (transform matrix) of at least two discrete transform equations (each row of the transform matrix corresponding to a discrete transform equations) and having at least two transform constants as claimed. Further, the claims do not require all transform constants in the collection to be scaled by the same constant. Indeed, the claims only require each discrete cosine transform constants to be scaled by one of the discrete cosine transform constants. This requirement is clearly met by both Dierke and Pineda as explained in the last Office action. Further, it should be note that any number that represented in binary for digital processing is

- 5. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
- 6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
- 7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Chuong D. Ngo whose telephone number is (703) 305-9764. The examiner can normally be reached on Monday-Friday from 7:30 AM to 6:00 PM.

The fax phone number for the organization where this application or proceeding is assigned are as follows:

Serial No: 09/694,452

Art Unit: 2124

5

(703) 746-7238 (After Final Communication) (703) 746-7239 (Official Communication)

(703) 746-7240 (For Status inquiries, draft communication)

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-3900.
